

Content Management System

Developed and written by: Luke Montgomey, Jude Ampfer, Logan Poe, and Paul Huffman

Our content management system allows for the posting, editing, commenting, and deletion of music album reviews. The goal was to make a website where users can enter the details of an album and leave reviews for such albums. Others would then be able to navigate the various entries and view its content. The system works by using JSONblob.com as a database. Data types stored are album composer, name, genre, release date, label, description, the user's review and their name. Our design uses pagination to display all of the data on various entities. The service uses javascript, jQuery, HTML, and JSONblob.com to make dynamic web pages via an API. Individual pages for adding, editing, and reviewing entries are present. A color palette is applied to every page and element of the website. Buttons were made large and colored for an easy to use interface.
